Abstract: Objective: To study and compare the nursing effect of WeChat platform nursing intervention in dermatology outpatients. Methods: Select the patients who were treated in the dermatology outpatient department of our hospital from 2021 to 2022, and a total of 90 patients were included in the study, and the number plate of 1 to 90 was randomly assigned, the patients were assigned to the routine nursing treatment group, and the patients assigned to the double number were assigned to the nursing intervention group of wechat platform. After the three-month treatment of the two groups, the data was collected, and the changes of the parameters and indicators before and after the treatment were compared, and analyzed accordingly. Results: According to the treatment results, the patients in the nursing intervention group of WeChat platform have significantly improved their understanding of skin diseases and treatment compliance. In contrast, the index change of the patients in this group was more ideal, and the difference between the two groups of data indicators was statistically significant, with p <0.05. Conclusion: According to the results, WeChat platform nursing intervention is a more effective measures, after the implementation of nursing intervention, patients for skin disease knowledge and treatment compliance in various aspects have obvious changes, the popularization of the technology not only improve the quality of life, also increased the nursing patients for their nursing treatment comprehensive satisfaction, to create a good relationship has a very positive effect. Therefore, this measure can be actively applied in future nursing, which is guiding for clinical nursing work.
