Nursing Care of Blood Cell Separation in Patients with Thrombocytosis

Mi Wu

The Second People's Hospital of Bijie City Guizhou Bijie 551700

Abstract: The main purpose of the relevant work in this article is to study the care method of the blood cell separator for platelet removal in patients with hemocytosis. According to a certain period of time in the hospital, 11 patients with primary thrombocytosis were selected. The team conducted nursing work for these patients, and comprehensively observed and evaluated the mood, response, satisfaction and other aspects of the patients in the nursing process. After a certain nursing work for patients, most of the patients are able to fully obey the doctor's advice, but there are still a small part do not comply with or is not completely comply with, in our 11 cases, there are seven patients can fully comply with the doctor's advice, three patients can comply to a certain extent, and one patient does not comply. At the same time, the satisfaction degree of the patients with the nursing work was also gradually improved. Among them, 8 patients were very satisfied with the nursing work, 2 patients were relatively satisfied, and 1 patient was not satisfied. In addition, after the nursing, the patient's anxiety and other mood have been improved significantly, and the occurrence of adverse reactions are also very few. According to the above content, it can be summarized that the use of blood cell separator to remove platelets for patients plays a very important role, which can not only effectively avoid the occurrence of adverse reactions, but also improve the patients' diseases, which should be widely promoted and applied.
