Analysis of Gastroenterology Nursing Risk and Its Management Countermeasures

Dan Liu Xiaolan Zou Shuangshuang Wang*

Bishan Hospital of Chongqing Chongqing 402760

Abstract: To explore the nursing risks that often occur in gastroenterology, and to formulate specific nursing management measures in combination with relevant influencing factors. Exploring 40 patients admitted to a hospital's gastroenterology department, analyzing the risk factors in the nursing process of these patients, comparing the probability of risk events before and after nursing, and evaluating the patients' satisfaction with this work before and after nursing. Evaluation. It can be seen from the final exploration results that the probability of nursing risk events in gastroenterology patients after nursing is lower than that of nursing. The comparison of these two data is different, and the satisfaction after nursing is higher ($P < 0.05$). Therefore, formulating relevant nursing management measures for nursing risks often encountered in gastroenterology can not only reduce the probability of nursing risk events, but also improve patient satisfaction.
